

## Dealing with Oil & Grease

Industrial premises that make discharges to sewers, as a consequence of their processes, have to install complex grease trap systems to meet the discharge requirements. This directed cost is contributing to circular

**Environment - United** has designed a system for the control of buildup of organic matter in sewer lines from commercial premises and public sewers. Anglian Water Services (AWS) management agreed to a trial being set up to test the efficacy of the Environmental Biotech system at a sewerage pumping station they identified as being particularly troublesome and expensive to operate because of the accumulation of fats, oils and greases (FOG). Following an initial inspection, Environmental Biotech purchased a biogas holding system which was installed. A 20 litre reservoir for the vegetative bacteria was fitted to the electrical control block together with a peristaltic pump and a small air compressor. These were controlled by a simple timer mechanism. Environmental Biotech's system of FOG control involving a biogas plant bioreactor product that is regularly activated and routinely installed at the site by trained technicians has proved its effectiveness during the trial. It has prevented the accumulation of FOG and kept any residual material in a soft form amenable for pumping station operation.

## HEALTH & HYGIENE

### Freshen up rooms & bars

Launched in July 2007 to coincide with the introduction of the smoking ban, Vaporize is specifically designed to neutralize lingering odours. The Vaporizer comes in a simple release packet or fogger that fits neatly simply placed on the floor of the room to be cleaned, passes a filter and acts for up to 60 minutes. Upon releasing the vapor is neutralized and the room is left smelling neutralized fresh. Vaporize works differently from air fresheners that disperse perfume to mask unpleasant smells. Its active ingredients are essential oils such as eucalyptus, which encapsulate various particulates and effec-
